

Because he's depending on you for a safe recovery

With your institution's subscription to ClinicalKey, you have access to trusted answers and deep insights that support you in making exceptional clinical decisions, even for your most complex patient cases.

Trust continually updated clinical content to help you keep patients safe and comfortable

Anesthesiologists play an important role in the safety of patients before, during, and after procedures both minor and major. You're also an invaluable resource when it comes to diagnosing and treating chronic pain, cancer pain, and pain from severe injuries and critical illnesses. And yet, free online sources and summary information alone fail to deliver the deep, evidence-based answers you need to effectively evaluate if it's safe for a patient to go under anesthesia, monitor patients to ensure stable vitals, and prepare post-procedure care plans.

With ClinicalKey, you'll have comprehensive answers from authoritative sources, including renowned journals in your field, so your decisions and treatment plans use the latest evidence to help make procedures a nonevent for the patient—while creating an optimal environment for the care team.
